Save once. Load when you choose.

A shared collection of setups, with explicit control on every character.

UI setup

How your interface looks.

My UI

Layout and supported preferences

My UI - Druid

A separate setup for form-friendly bars

Specialization loadouts

How your chosen build plays.

Priest / Discipline / Everyday

Action bars, keybindings, character macros

Priest / Holy / Raiding

Its own independent saved entry

THREE ORDINARY ACTIONS

Load / Apply

Preview and change this character.

Save

Replace the selected saved entry.

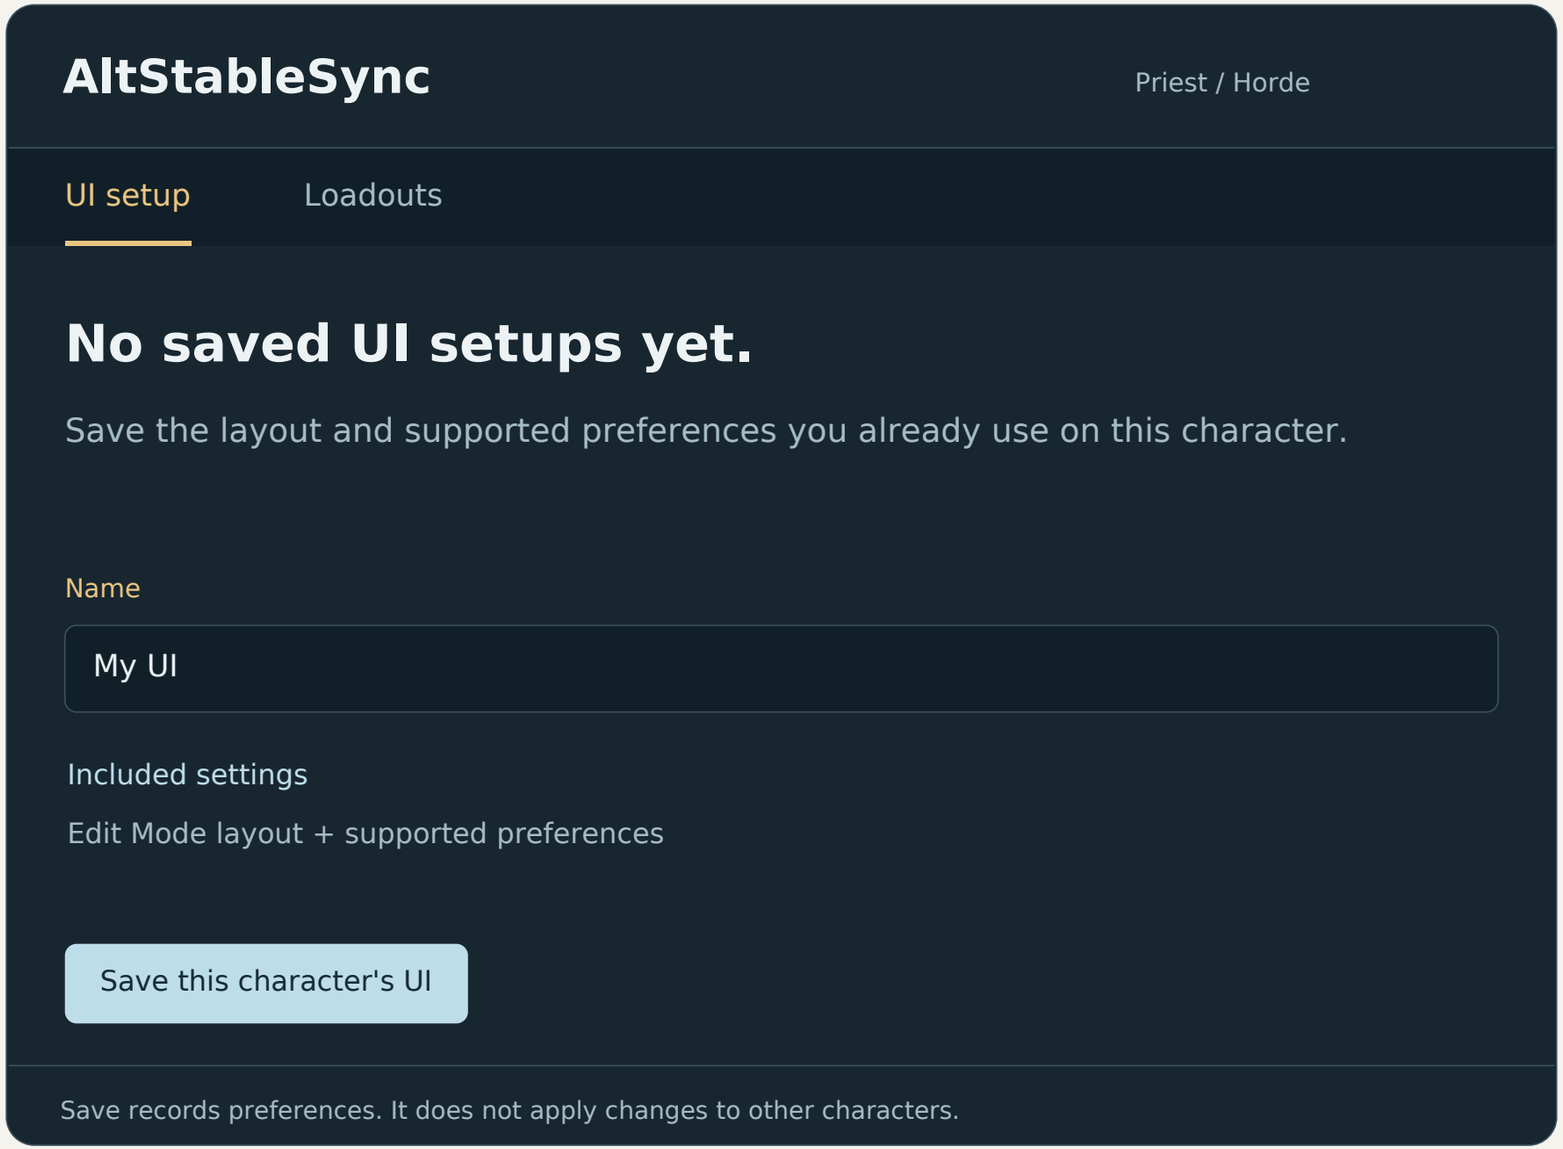

Save As

Keep the original and create a copy.

Local edits stay local. Saving never automatically applies a setup to other characters.

Start with the character you already like.

Create the first UI setup. No defaults are invented for an empty library.

FIRST SAVE

One useful starting point.

PLAYER

Set up the first character normally, then save it as My UI.

PRODUCT

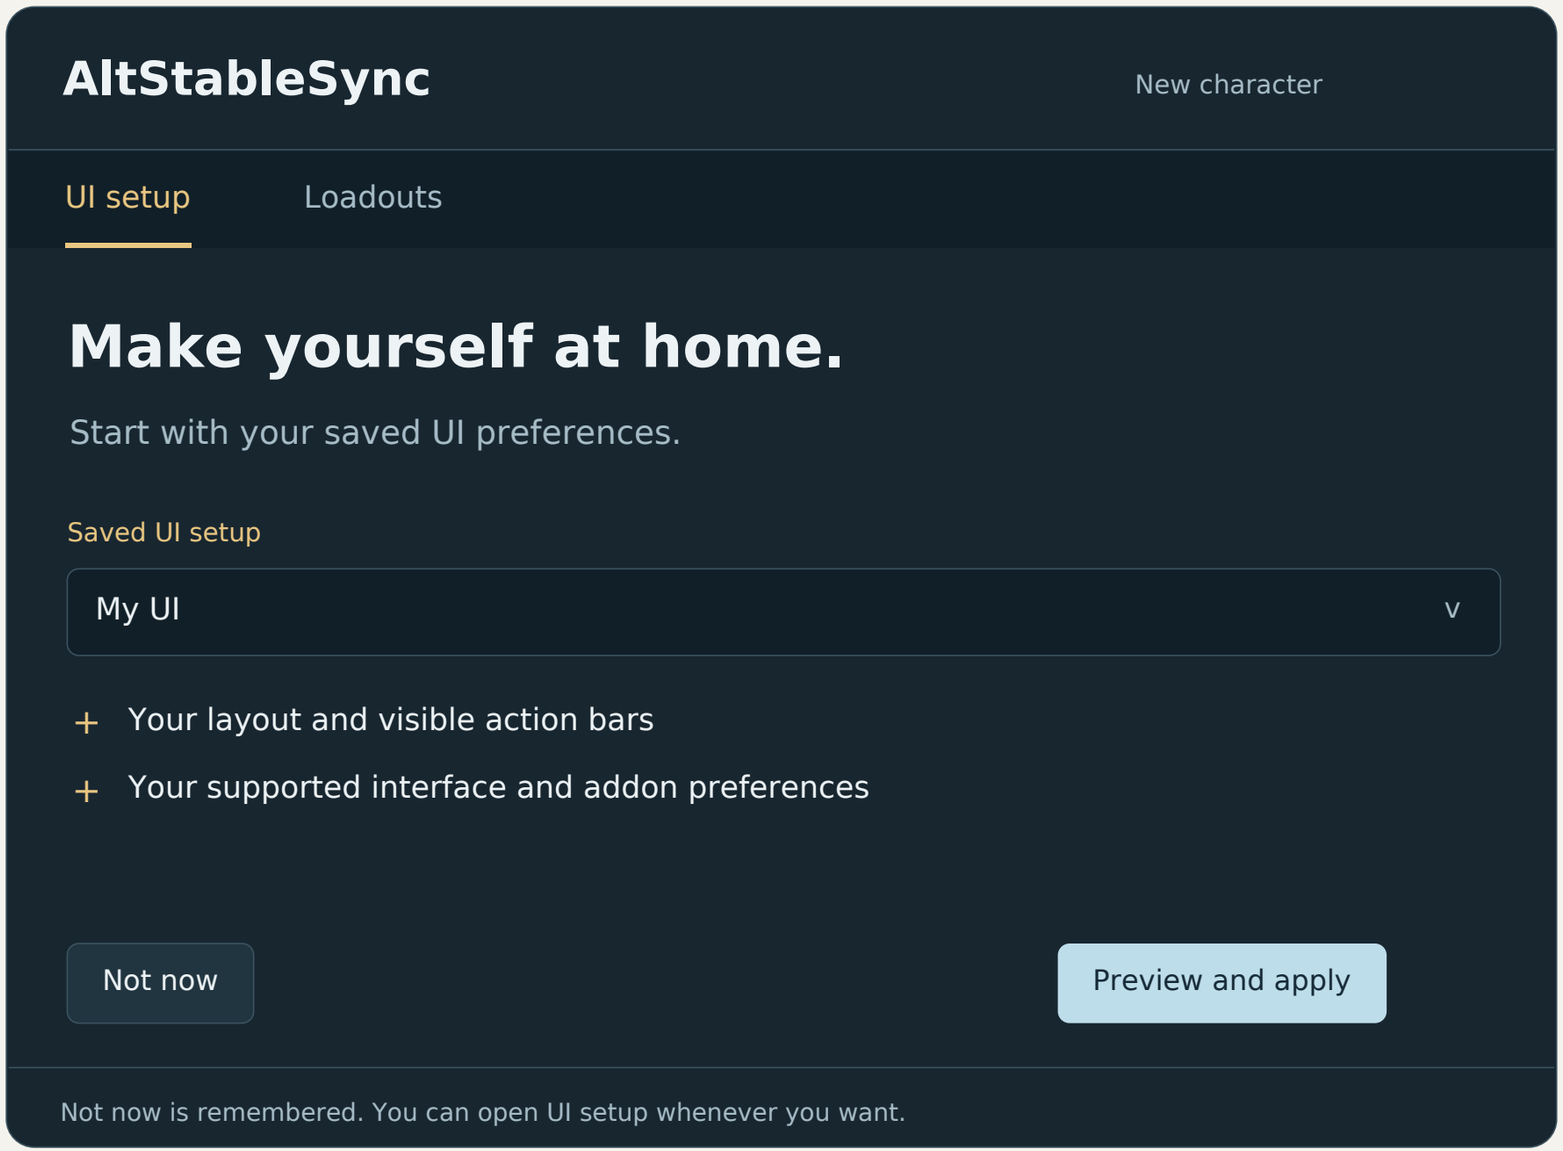

Show supported fields. Capture only after character data is ready.

RESULT

My UI is available in the shared catalog for the next character.

A new character gets a simple invitation.

Choose a saved UI setup, review it, and apply it once.

ONBOARDING

One choice, no subscription.

PLAYER

Pick My UI or dismiss the offer.

PRODUCT

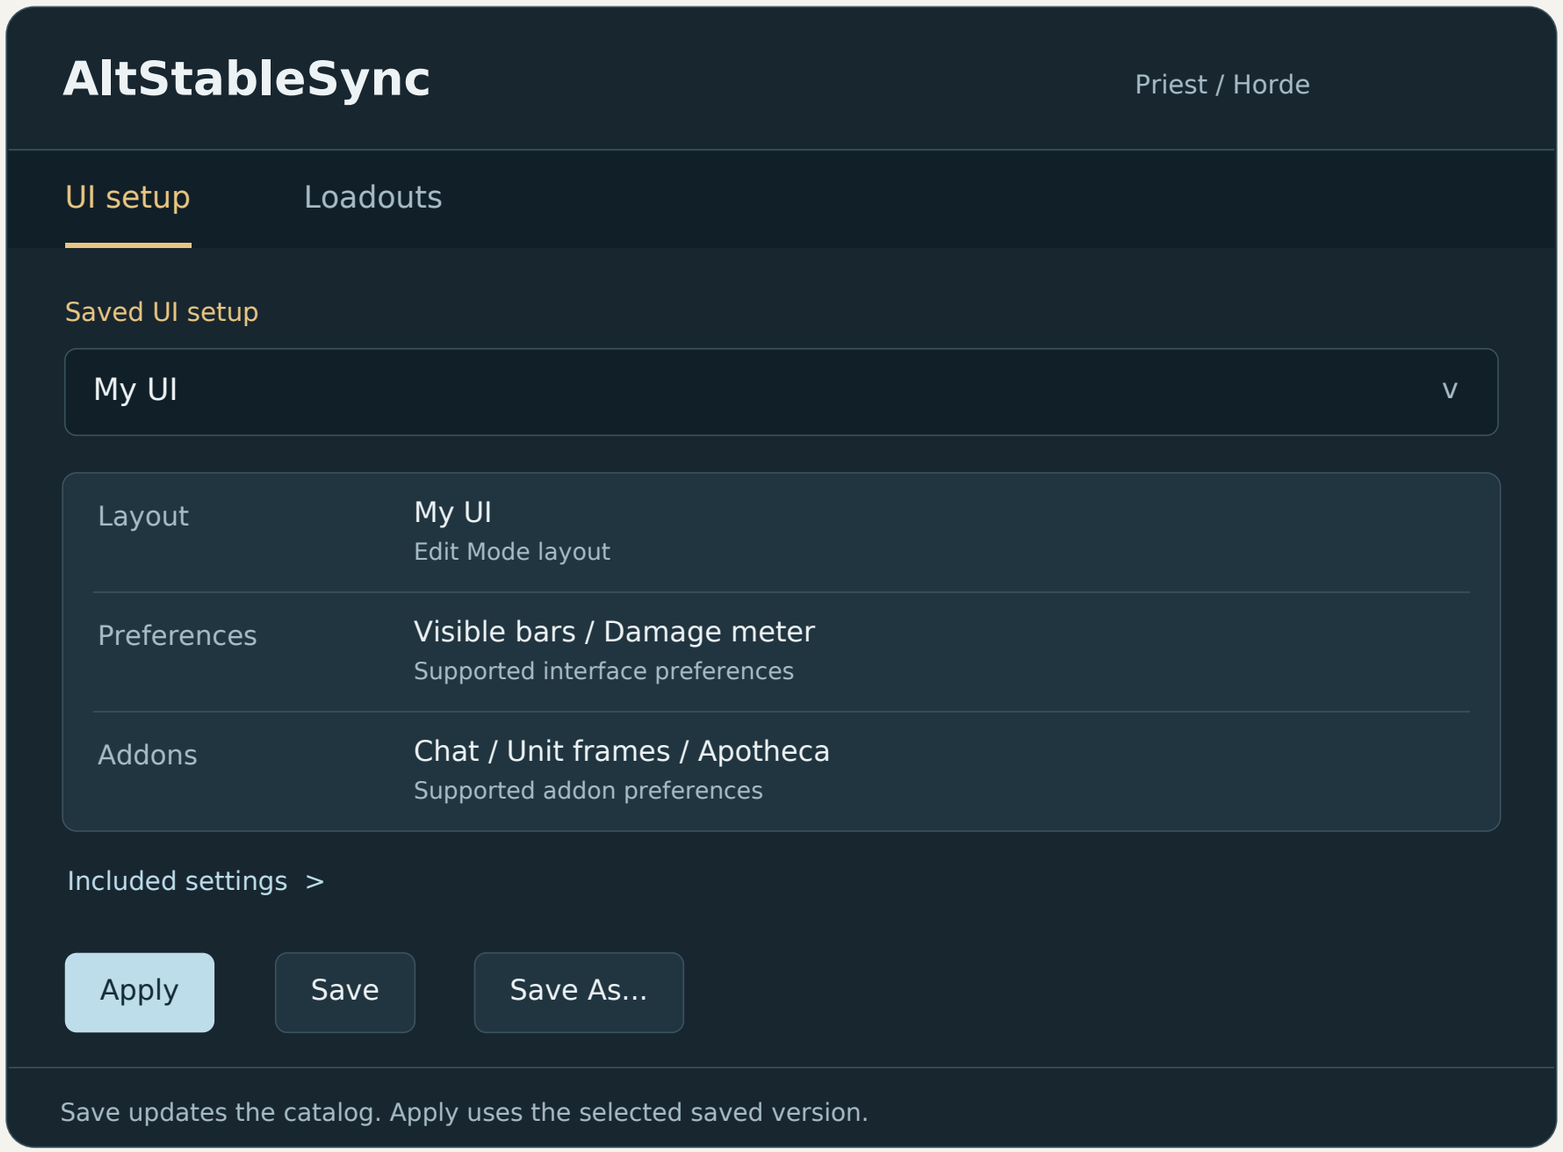

Preview supported changes and wider-scope effects. Back up before applying.

RESULT

The character starts from that saved setup. Future changes remain deliberate.

Keep UI setup familiar.

Apply the saved setup, update it from this character, or save a different version.

MAIN WINDOW

The same three actions.

PLAYER

Save My UI again from any character when the preferred setup improves.

PRODUCT

Other characters keep their current state until they apply it.

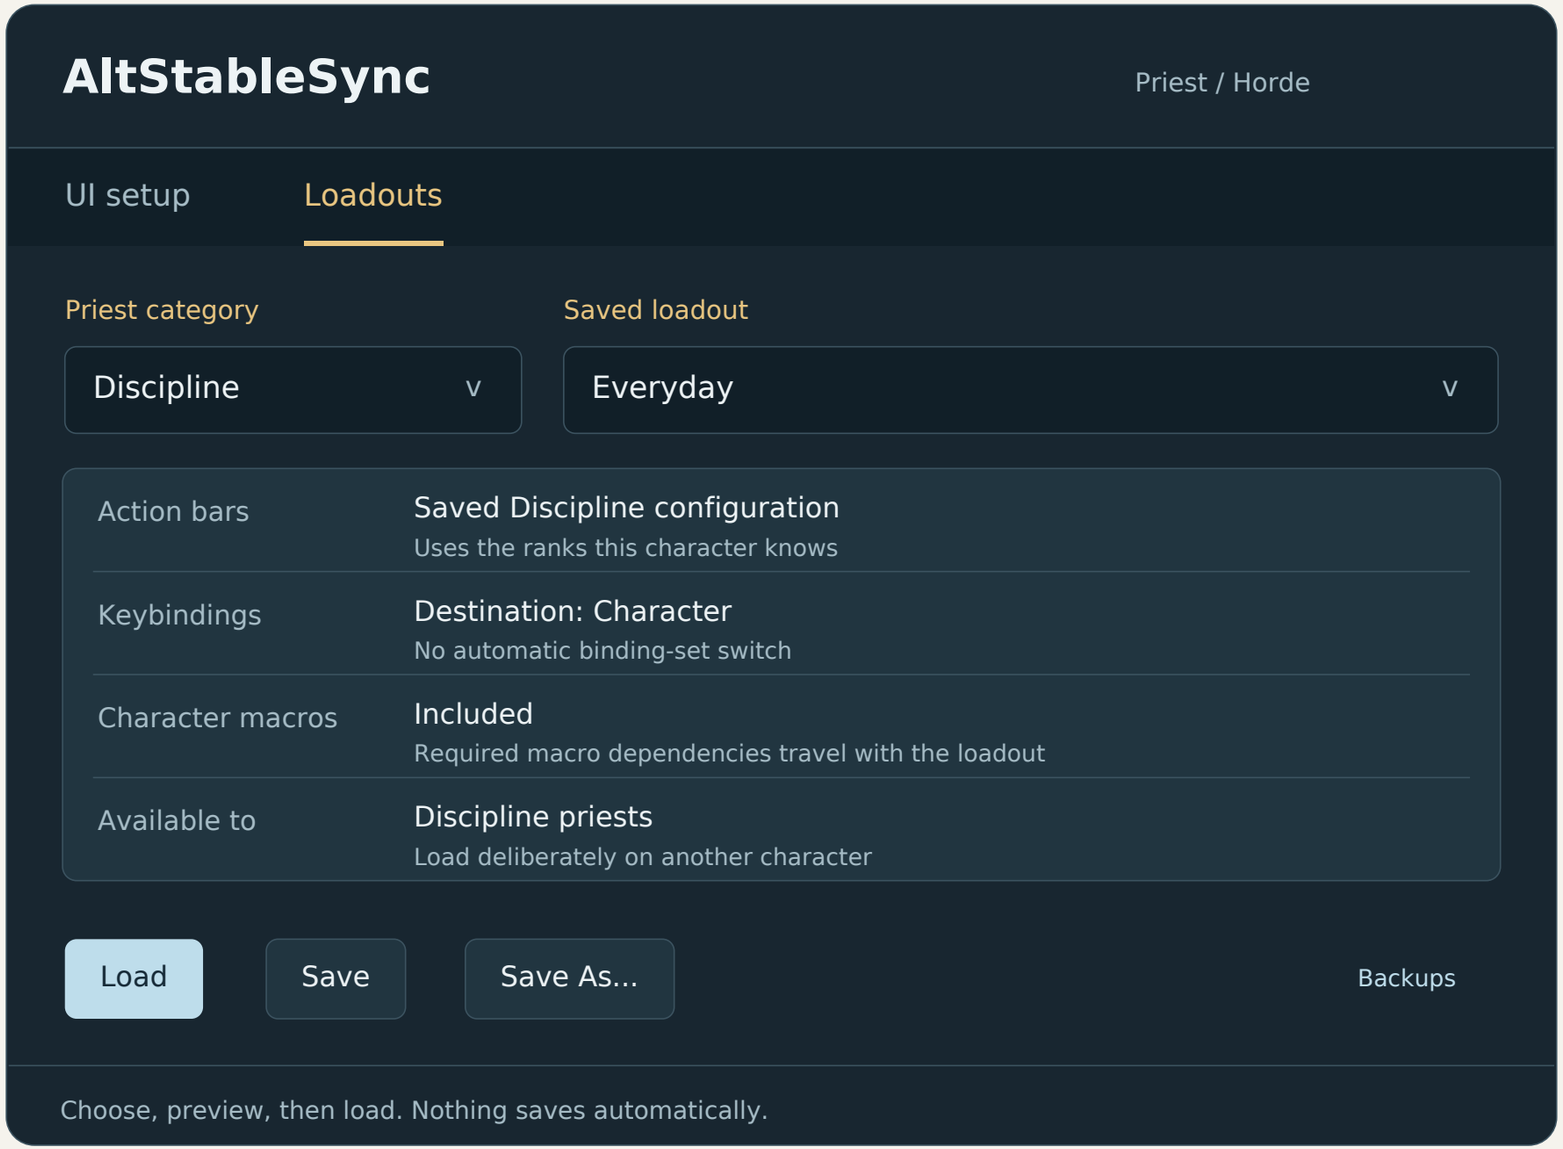

DETAILS

Disclose account-wide settings and unsupported providers in preview.

The listed addon preferences are desired examples, not a claim of current support.

Choose the build, then the saved loadout.

Discipline, Holy and Shadow have independent lists. The category does not change talents.

LOADOUTS

Named setups, not a master character.

PLAYER

Select Discipline and Everyday. Click Load only when ready.

PRODUCT

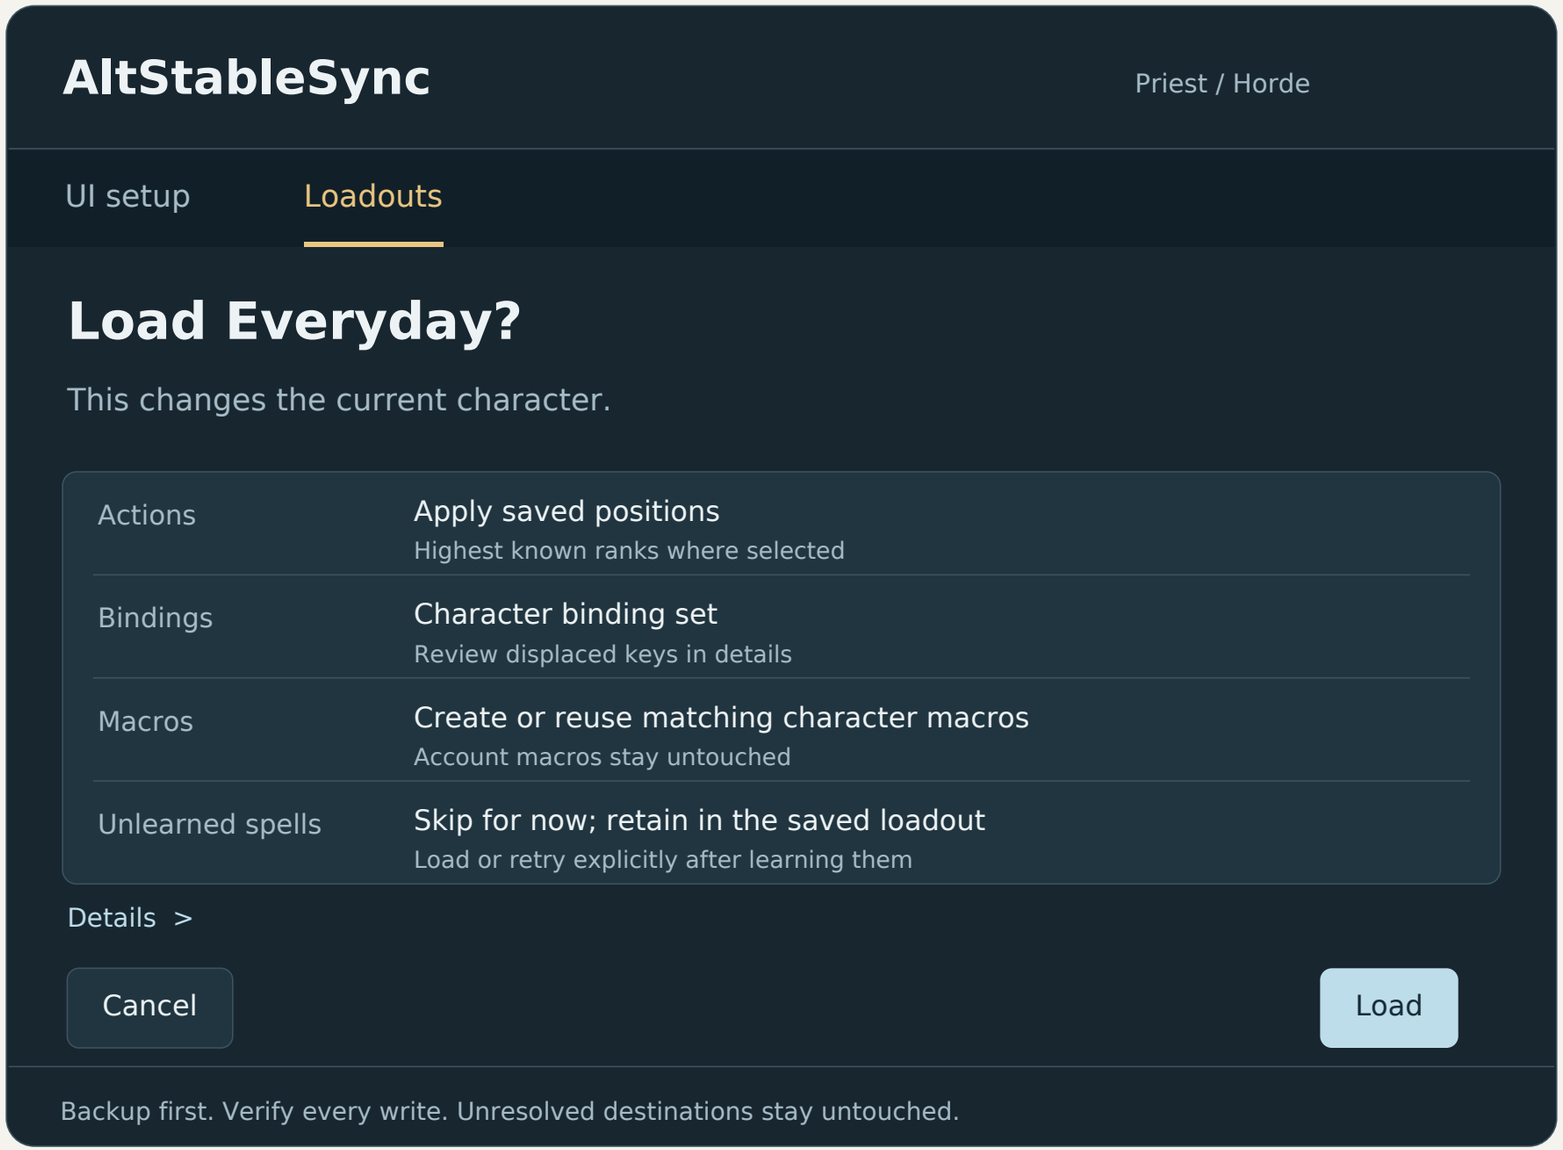

Selecting a dropdown entry does not change game state.

RESULT

Any character can load or explicitly save. Level does not determine ownership.

Preview the changes before loading.

The safety engine stays. The normal path remains one short review.

LOAD PREVIEW

A small review with real safeguards.

PLAYER

Review what changes and what cannot be loaded.

PRODUCT

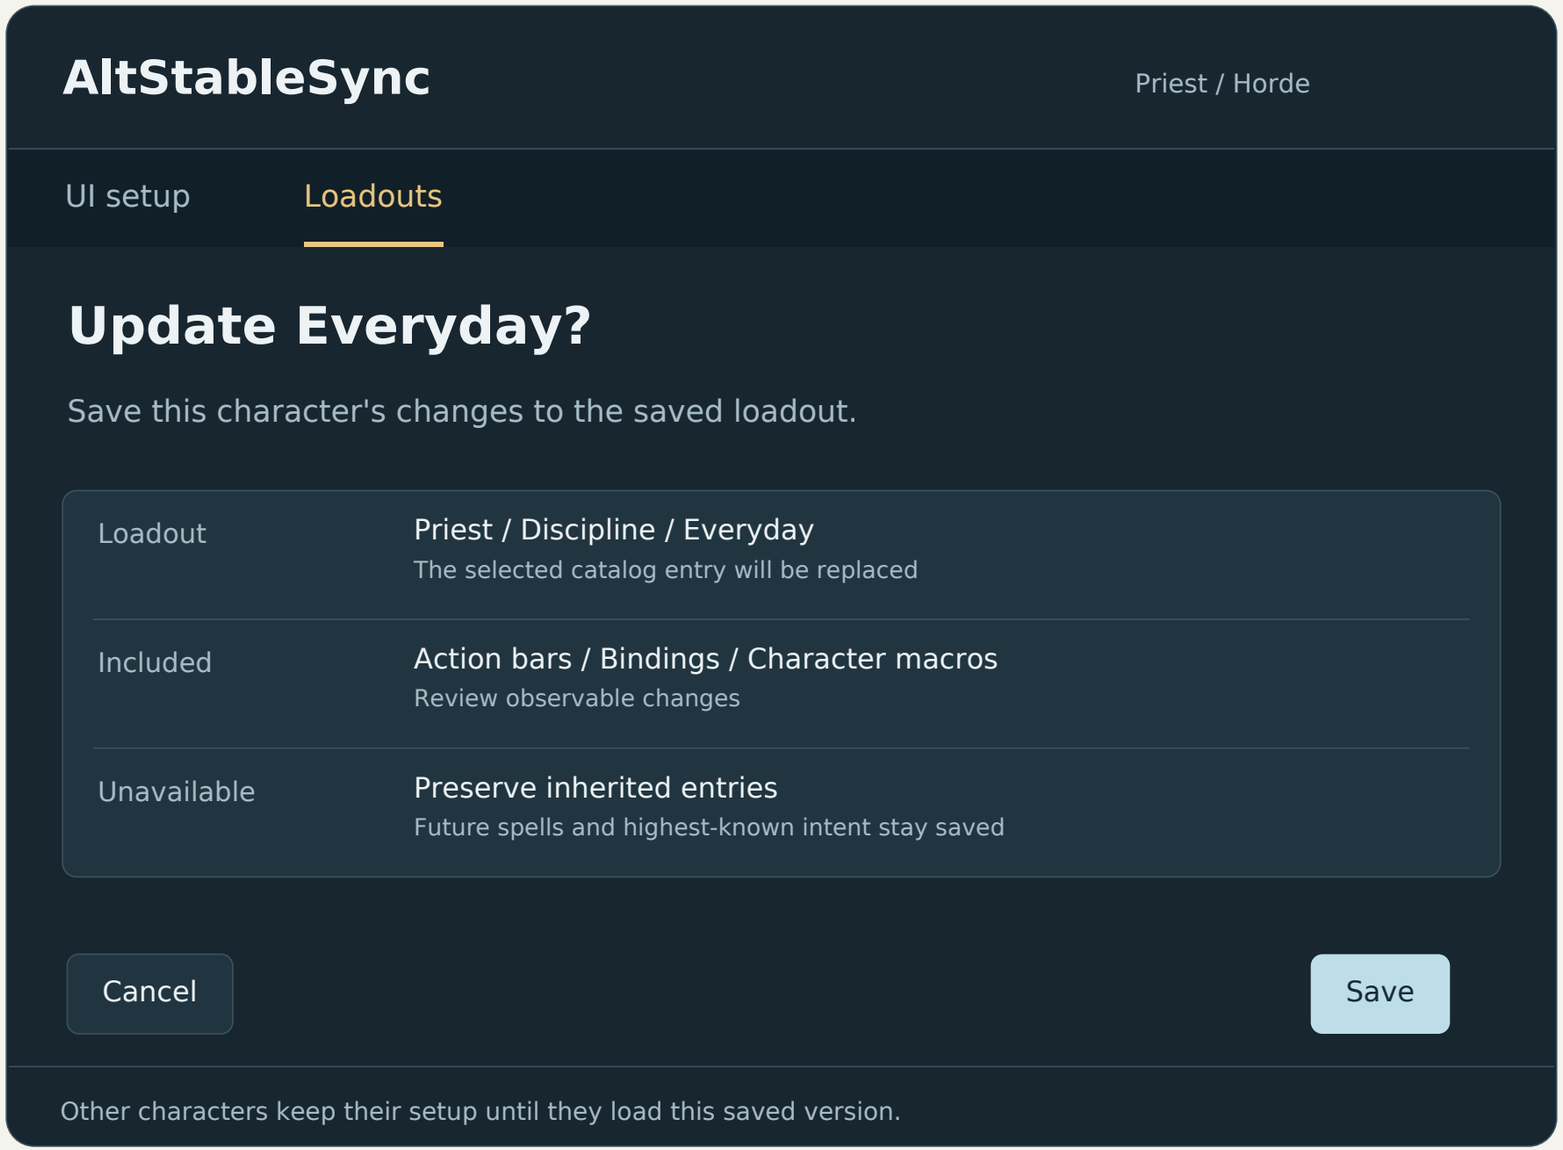

Resolve dependencies, back up, write and read back. A failed backup means no writes.

RESULT

Report partial outcomes honestly. Never empty all bars before import.

Save only when the change is intentional.

An accidental drag stays local. A deliberate improvement can replace the saved entry.

EXPLICIT SAVE

No publishing workflow to learn.

PLAYER

Improve a macro on a low-level alt, then choose Save.

PRODUCT

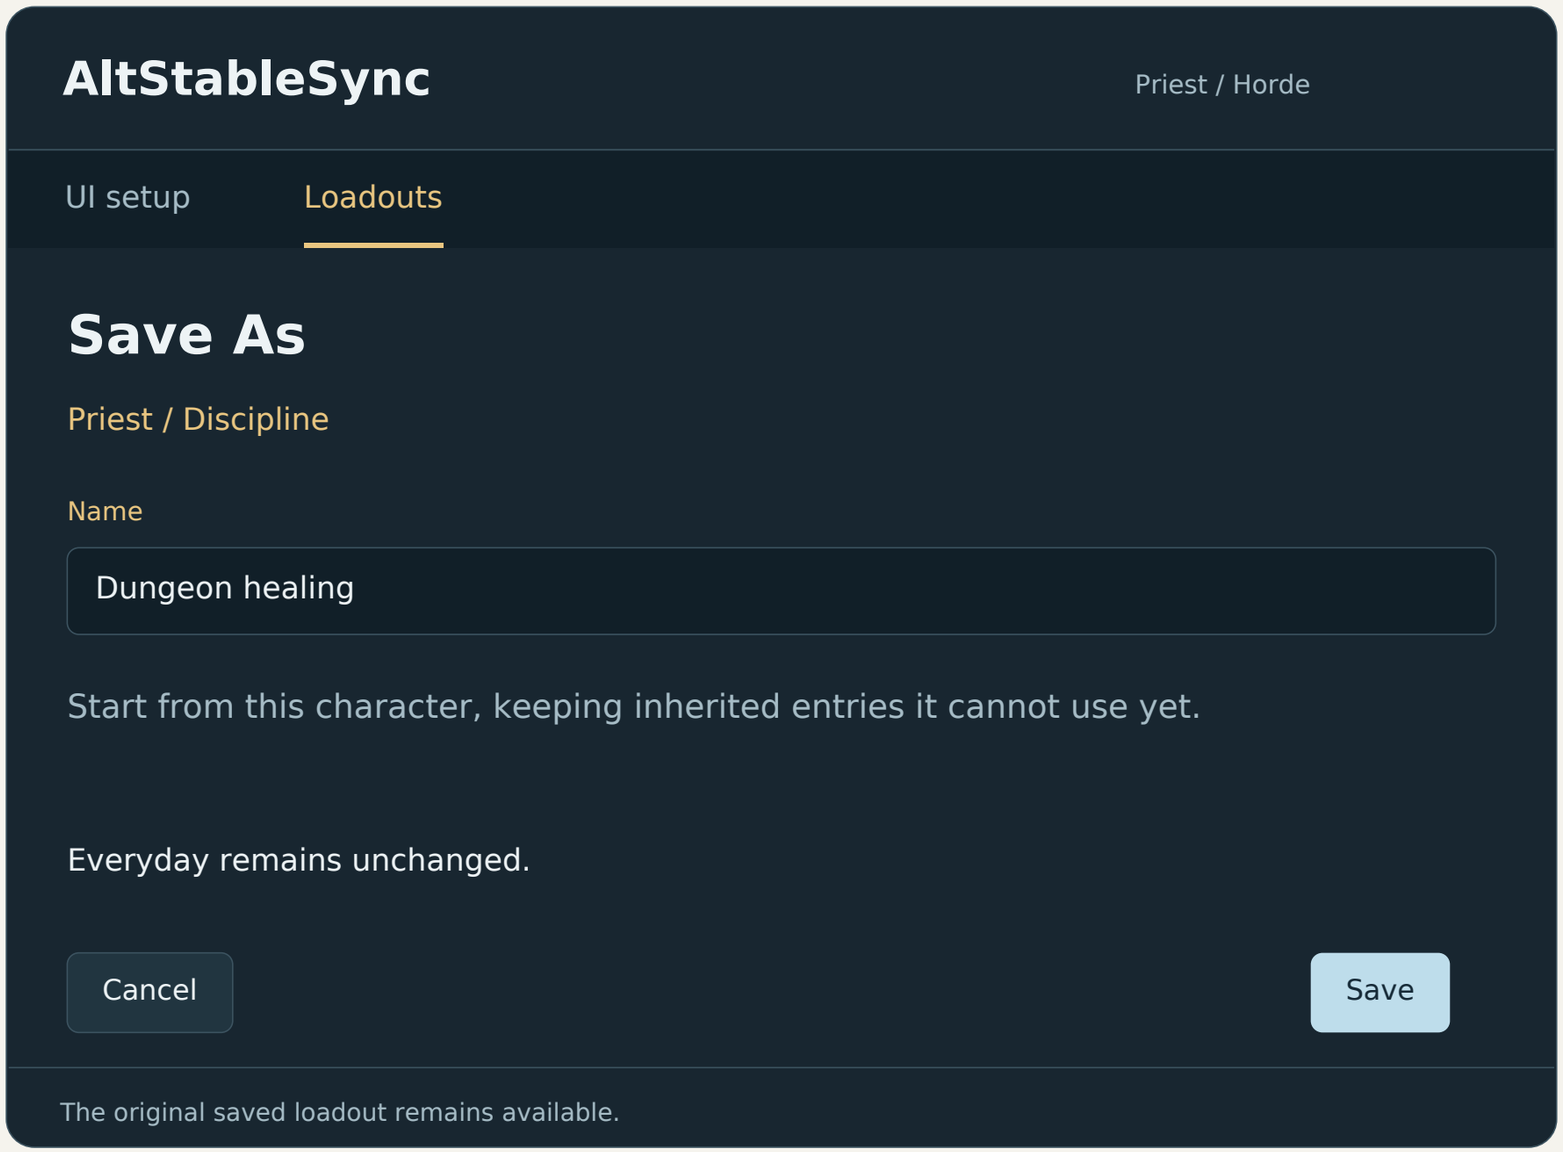

Keep inherited future spells and unavailable provider data. Guard against stale overwrite.

RESULT

The saved entry improves. Nobody else changes until they load it.

Save a variation without changing the original.

Save As uses a name and creates a separate entry in the same category.

SAVE A COPY

Variants stay ordinary.

PLAYER

Create Dungeon healing, PvP - Horde, or another useful variant.

PRODUCT

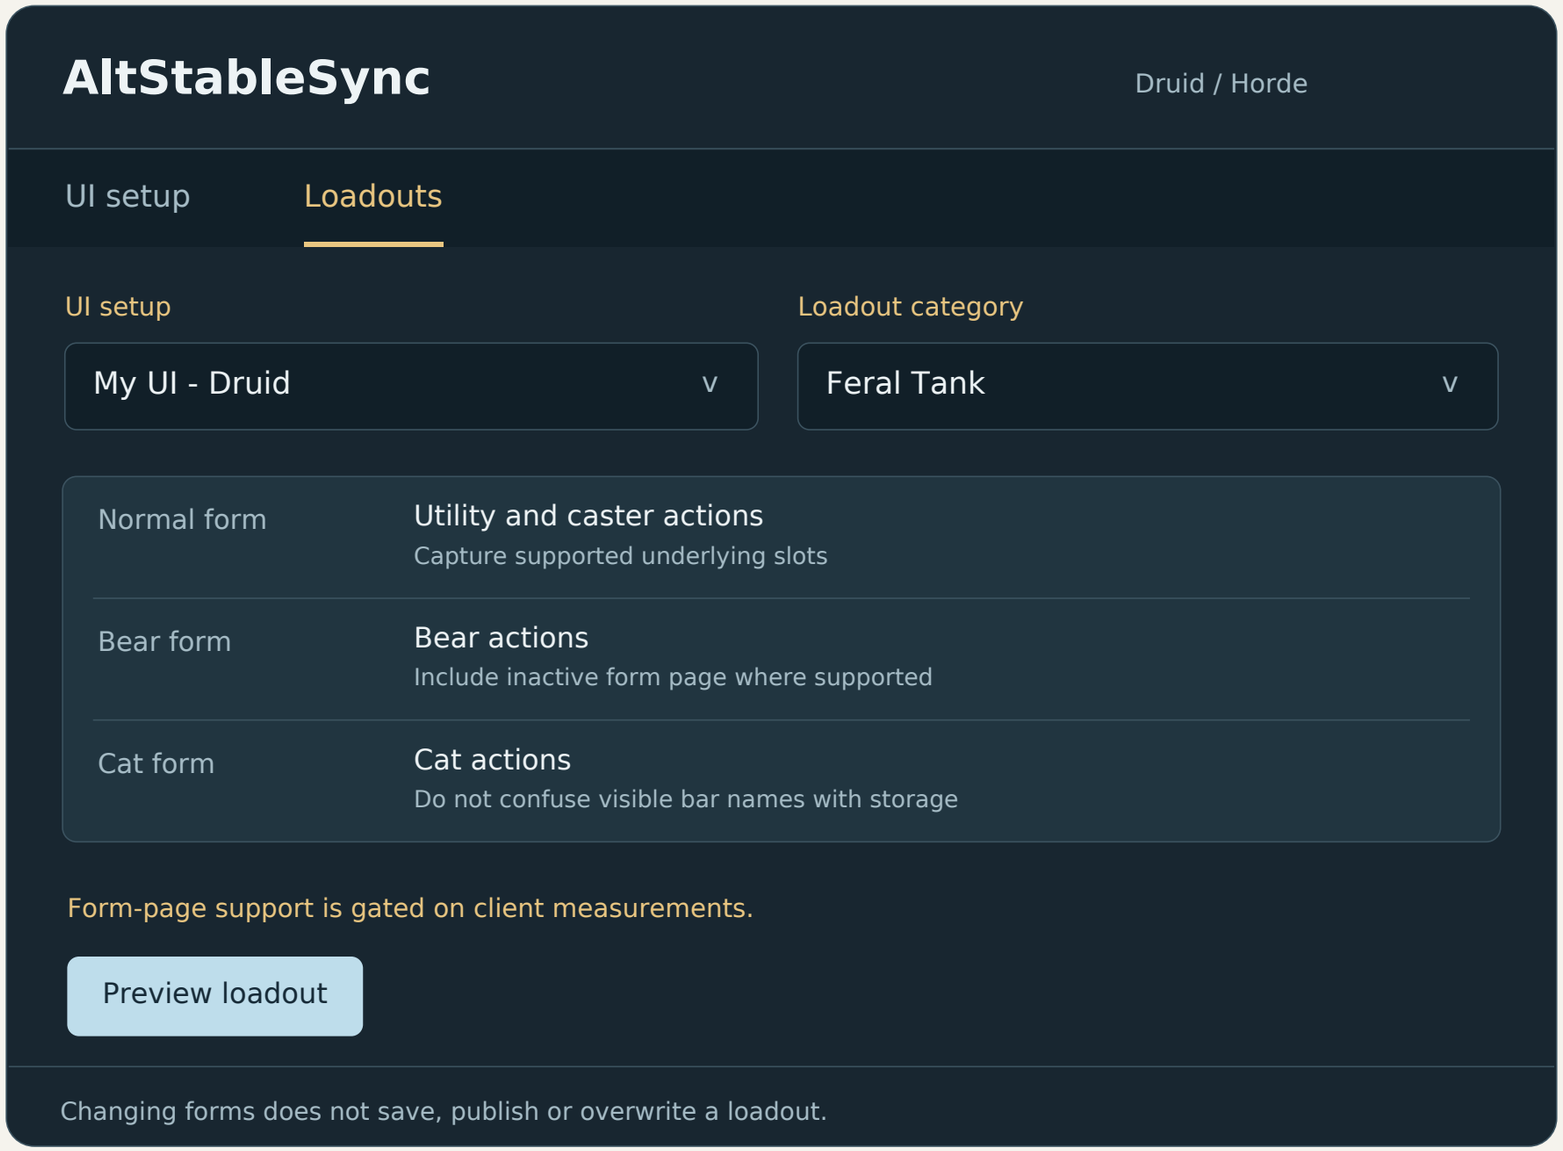

New identity; no automatic faction rewriting or inheritance layers.

RESULT

Choose whichever entry fits this character when loading.

Druids get a setup that respects their forms.

A separate UI preset handles geometry. The loadout holds verified action-page content.

DRUID VARIANT

No form-layer editor.

PLAYER

Use My UI - Druid instead of forcing the same eight-bar arrangement.

PRODUCT

Probe paging and slot aliases. Never assume every visible bar is independent.

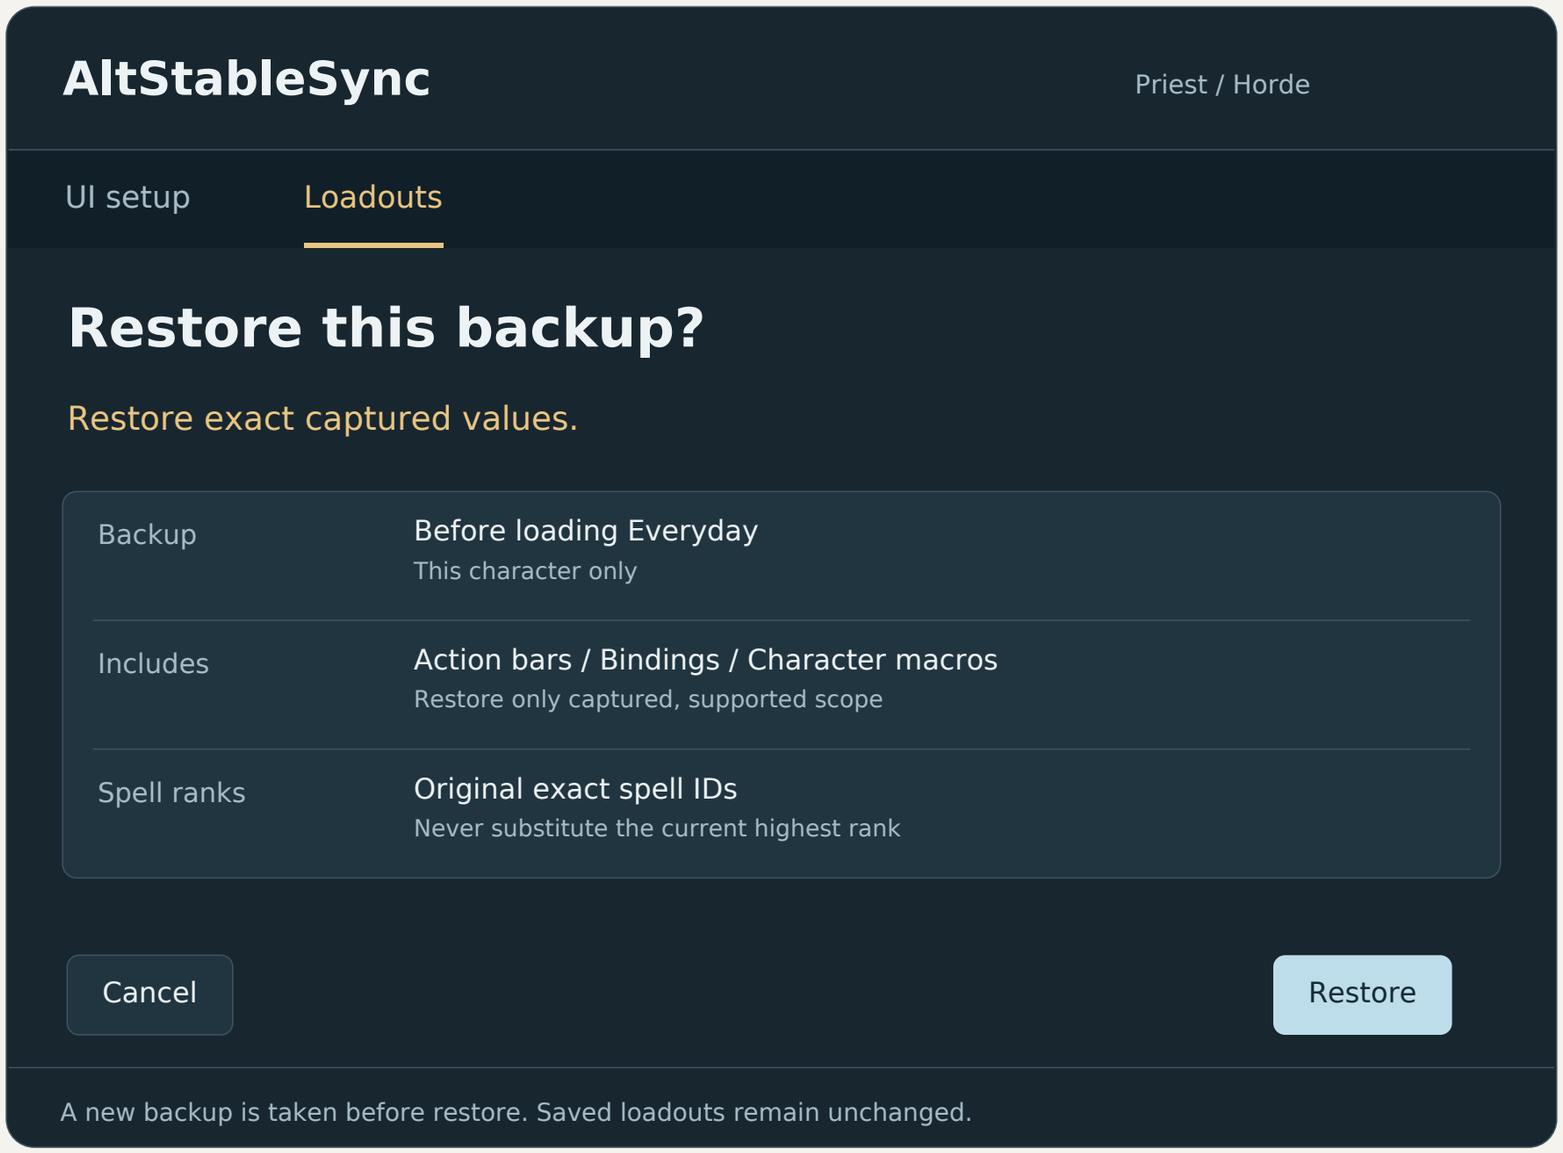

RESULT

A supported loadout preserves normal and form-specific actions.

Illustrative druid detail view. Exact supported pages must be proved before release.

Restore the actual before-state.

Backups are snapshots of this character, distinct from reusable saved loadouts.

RECOVERY

A different operation from Load.

PLAYER

Choose a backup and review Restore.

PRODUCT

Back up again, restore exact values and verify. If something is unavailable, say so.

RESULT

The previous character setup returns within supported scope. The catalog is untouched.
